Methanol poisoning at a glance

Methanol is not toxic itself, but it is metabolized to the highly toxic formic acid/formate (see fig). The treatment is focused on blocking the enzyme (ADH) with either ethanol or fomepizole, buffer the metabolic acidosis with bicarbonate, and use dialysis to remove methanol, formate and correct the metabolic acidosis.

Folinic acid may also be given to enhance the endogenous metabolism of formate.

All of the above should be initiated as early as possible.

Diagnosis:
- **symptoms**: hyperventilation/dyspnoea, visual disturbances (all kinds of), GI-symptoms, chest pain.
- **findings**: Arterial blood gas: Metabolic acidosis (unless concomitant ethanol intake), increased anion- and osmolal gap, increased serum-formate.

Treatment:
- **Give bicarbonate** (NaHCO$_3$) as soon as possible intravenously. Aim at full correction (0.3 x weight x base excess (BE)) = mmol buffer (bicarbonate).
  - **or give 500 mmol if base excess >20 over 1 hour, repeat if necessary**
  
  If oral treatment: Tablets of 500 mg (= 6 mmol bicarbonate), 6-10 tablets every hour until acidosis/hyperventilation is corrected.

- **Give antidote** 1 or 2 without delay:
  1. **ethanol** orally or intravenously – dosing: See opposite side.
  2. **fomepizole** orally or intravenously – dosing: See opposite side.
     - **Duration of antidote**: Give antidote until 12-24 hours after dialysis is finished, preferably ethanol in order to save amount of fomepizole.

- **Dialysis** (intermittent, high-flow): Give for at least (6-) 8 hours if possible;
- **Folinic acid** (Rescuvolin® or Leucovorin®): 50mg iv or orally every 6 hours for 24 hours
- **If ventilator support**: The patient must be hyperventilated as long as acidicotic

Criterion for treatment (patients blood gases):
A. **Asymptomatic patients, normal blood gas**: Observe.
B. **pH>7.2, HCO$_3>$20**: Give bicarbonate. Observe minimum 24 hours
C. **pH 7.0-7.2, HCO$_3$ 10-20**: Give bicarbonate, ethanol (or fomepizole), consider HD
D. **pH<7.2, HCO$_3<$10**: Give bicarbonate, fomepizole (or ethanol), HD, folic acid

- **RE antidote**:
  - **fomepizole** availability is limited; therefore treat primarily only for the first 24 hours (two or max three doses per patient), then continue with ethanol after 24 hours
  - if dialysis is available immediately, give loading dose of fomepizole, then another dose after 4 hours of HD, then ethanol after the full course of HD (8 hours)
- **hemodialysis** (preferably intermittent, high flow (iHD). CVVHD if circulatory unstable, then >16 hrs)
  - consider in all patients with significant acidosis (pH <7.0-7.1, HCO$_3$<10) or visual disturbances. Always perform for at least 8 hours if possible to eliminate all methanol

Prognostic aspects
Coma on admission, severe metabolic acidosis (pH<7.0) and lack of hyperventilation in spite of severe acidosis are the most prominent poor prognostic features on admission
Suggested dosing regimen for ethanol (be aware of individual differences, control blood gases during treatment):

<table>
<thead>
<tr>
<th></th>
<th>iv 5% ethanol</th>
<th>iv 10% ethanol</th>
<th>Oral 20% ethanol</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Loading dose</strong></td>
<td>15mL/kg</td>
<td>7.5mL/kg</td>
<td>5mL/kg</td>
</tr>
<tr>
<td><strong>Infusion rate</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>(not regular drinker)</td>
<td>2-4mL/kg/hr</td>
<td>1-2mL/kg/hr</td>
<td>0.5-1mL/kg/hr</td>
</tr>
<tr>
<td>(regular drinker)</td>
<td>4-8mL/kg/hr</td>
<td>2-4mL/kg/hr</td>
<td>1-2mL/kg/hr</td>
</tr>
<tr>
<td><strong>Infusion rate</strong></td>
<td></td>
<td></td>

<tr>
<td>during HD (not regular drinker)</td>
<td>4-7mL/kg/hr</td>
<td>2-3.5mL/kg/hr</td>
<td>1-1.75mL/kg/hr</td>
</tr>
<tr>
<td>(regular drinker)</td>
<td>6-10mL/kg/hr</td>
<td>3-5mL/kg/hr</td>
<td>1.5-2.5mL/kg/hr</td>
</tr>
</tbody>
</table>

If Serum-ethanol analyses are available: aim at serum-ethanol 100-150mg/dL

Suggested dosing of fomepizole:
- **Normal dosing:**
  - Loading dose 15mg/kg, then
  - 10mg/kg every 12 hour (every 4 hour during HD)
- **Dosing during outbreak with limited capacity or availability of fomepizole:**
  - Loading dose 10mg/kg, then
  - 10mg/kg every 12 hour (every 4 during HD) for the first 24 hours, then use ethanol to save fomepizole
  - Suggested use of ethanol also after discontinuation of HD (6-8 hours of HD) to save fomepizole

Preparing fomepizole:
5mg/mL: To be diluted in 500-1000mL 50 mg/dL glucose or 9mg/mL NaCl. Infuse over 30min. Remove some content of glucose/saline before injecting fomepizole into infusion bag. Some pain on injection site may occur (local irritation) if not given via central vein.

Formate analysis - use in clinical setting:
If no formate is produced from methanol poisoning, no symptoms occurs, i.e. ANY patients with a metabolic acidosis because of a methanol poisoning must have traceable formate:
